## ST2334 (2021/22 Semester 1)

Solution to Tutorial 5

#### Ouestion 1

X	2	3	4	5	6
$f_X(x)$	0.01	0.25	0.40	0.30	0.04

- (a) First moment:  $E(X) = \sum x f_X(x) = 2(0.01) + \dots + 6(0.04) = 4.11$ . Second moment:  $E(X^2) = \sum x^2 f_X(x) = 2^2(0.01) + \dots + 6^2(0.04) = 17.63$ .
- (b) (i) Definition:  $V(X) = \sum (x \mu)^2 f_X(x)$ . Hence,  $V(X) = (2 4.11)^2 0.01 + \dots + (6 4.11)^2 0.04 = 0.7379$ .
  - (ii) Computation formula:  $V(X) = E(X^2) [E(X)]^2 = 17.63 4.11^2 = 0.7379$ .
- (c) E(Z) = E(3X 2) = 3E(X) 2 = 3(4.11) 2 = 10.33. $V(Z) = V(3X - 2) = 3^2V(X) = 9(0.7379) = 6.6411.$
- (d) The probability function of Z is given by

/	<u> </u>				
X	2	3	4	5	6
Z(=3X-2)	4	7	10	13	16
$f_Z(z)$	0.01	0.25	0.40	0.30	0.04

Mean:  $E(Z) = \sum z f_Z(z) = 4(0.01) + \dots + 16(0.04) = 10.33$ .

Variance:  $V(Z) = \sum (z - \mu)^2 f_Z(z) = (4 - 10.33)^2 0.01 + \dots + (16 - 10.33)^2 0.04 = 6.6411$ .

(e) W = aZ + b

Mean: E(W) = aE(Z) + b = 10.33a + b

Variance:  $V(W) = a^2V(Z) = 6.6411a^2$ 

### Question 2

X	0	1	2	3	4	5
$f_{X}(X)$	1/15	2/15	2/15	3/15	4/15	3/15

$$E(X) = \sum x f_X(x) = 0(1/15) + \dots + 5(3/15) = 46/15 = 3.0667.$$

Profit = revenue  $-\cos t$ 

$$= 1.65X + \frac{3}{4}(1.20)(5 - X) - 5(1.20) = 0.75X - 1.50.$$

Expected Profit, E(Profit) = E(0.75X - 1.50) = 0.75E(X) - 1.50 = 0.75(46/15) - 1.50 = \$0.80.

### Question 3

(a) Since

$$Pr(X \ge 1) = Pr(X = 1) + Pr(X = 2) + Pr(X = 3) + Pr(X = 4) + \cdots$$
  
 $Pr(X \ge 2) = + Pr(X = 2) + Pr(X = 3) + Pr(X = 4) + \cdots$   
 $Pr(X \ge 3) = + Pr(X = 3) + Pr(X = 4) + \cdots$   
 $Pr(X = 3) + Pr(X = 4) + \cdots$ 

Adding these equalities, we have

$$\sum_{k=1}^{\infty} \Pr(X \ge k) = 1 \Pr(X = 1) + 2 \Pr(X = 2) + 3 \Pr(X = 3) + \cdots$$
$$= \sum_{k=1}^{\infty} k \Pr(X = k) = E(X).$$

(b) Let  $X_1, X_2$  and  $X_3$  denote respectively the number obtained in the first, second and third die. Then  $M = \min\{X_1, X_2, X_3\}$ . For  $k = 1, 2, \dots, 6$ ,  $\Pr(M \ge k) = \Pr(X_1 \ge k, X_2 \ge k, X_3 \ge k)$   $= \Pr(X_1 \ge k) \Pr(X_2 \ge k) \Pr(X_3 \ge k)$  since  $X_i'$ s are independent  $= \left(\frac{6 - (k - 1)}{6}\right) \left(\frac{6 - (k - 1)}{6}\right) \left(\frac{6 - (k - 1)}{6}\right)$   $= \left(\frac{7 - k}{6}\right)^3$ .

In other words,

$$Pr(M \ge 1) = 1, Pr(M \ge 2) = \frac{5^3}{216}, Pr(M \ge 3) = \frac{4^3}{216},$$
  
 $Pr(M \ge 4) = \frac{3^3}{216}, Pr(M \ge 5) = \frac{2^3}{216}, Pr(M \ge 6) = \frac{1^3}{216},$ 

and  $Pr(M \ge k) = 0$  for  $k = 7, 8, 9, \dots$ 

It follows that

$$E(M) = \sum_{k=1}^{\infty} \Pr(M \ge k) = \sum_{k=1}^{6} \Pr(M \ge k)$$
$$= \sum_{k=1}^{6} \left(\frac{7-k}{6}\right)^{3}$$
$$= \frac{1^{3} + 2^{3} + \dots + 6^{3}}{6^{3}} = 2.0417$$

### Question 4

$$f_X(x) = \begin{cases} 2(1-x), & 0 < x < 1, \\ 0, & \text{otherwise.} \end{cases}$$

(a) The mean of X is given by

$$E(X) = \int_{-\infty}^{\infty} x \, f_X(x) dx = \int_{-\infty}^{0} x \, 0 \, dx + \int_{0}^{1} x \, 2(1-x) dx + \int_{1}^{\infty} x \, 0 \, dx$$
$$= 2 \int_{0}^{1} (x - x^2) dx = 2 \left[ \frac{x^2}{2} - \frac{x^3}{3} \right]_{0}^{1} = 2 \left[ \frac{1}{2} - \frac{1}{3} \right] = \frac{1}{3}.$$

The second moment is given by

$$E(X^{2}) = \int_{-\infty}^{\infty} x^{2} f_{X}(x) dx = \int_{0}^{1} x^{2} f_{X}(x) dx = 2 \int_{0}^{1} x^{2} (1 - x) dx$$
$$= 2 \int_{0}^{1} (x^{2} - x^{3}) dx = 2 \left[ \frac{x^{3}}{3} - \frac{x^{4}}{4} \right]_{0}^{1} = 2 \left[ \frac{1}{3} - \frac{1}{4} \right] = \frac{1}{6}.$$

Thus,

$$V(X) = E(X^2) - [E(X)]^2 = \frac{1}{6} - \left(\frac{1}{3}\right)^2 = \frac{1}{18}.$$

(b) Y = 3X - 2The mean of Y,  $E(Y) = 3E(X) - 2 = 3\left(\frac{1}{3}\right) - 2 = -1$ . The variance of Y,  $V(Y) = 3^2V(X) = 9\left(\frac{1}{18}\right) = \frac{1}{3}$ .

# Question 5

To solve for the two unknowns, a and b, we need two equations which come from the two conditions: (1)  $\int_{-\infty}^{\infty} f_x(x) = 1$  and (2) E(X) = 3/5.

$$\int_{-\infty}^{\infty} f_X(x) \, dx = \int_0^1 (a + bx^2) \, dx = \left[ ax + \frac{bx^3}{3} \right]_0^1 = a + \frac{b}{3}. \text{ Therefore } \int_0^1 f_X(x) \, dx = 1 \text{ gives}$$

$$a + \frac{b}{3} = 1 \qquad (1)$$

$$E(X) = \int_0^1 x(a + bx^2) \, dx = \left[ \frac{ax^2}{3} + \frac{bx^4}{3} \right]^1 = \frac{a}{3} + \frac{b}{3}. \text{ Therefore, } E(X) = \frac{3}{3} \text{ gives}$$

$$E(X) = \int_0^1 x(a+bx^2) dx = \left[\frac{ax^2}{2} + \frac{bx^4}{4}\right]_0^1 = \frac{a}{2} + \frac{b}{4}. \text{ Therefore, } E(X) = \frac{3}{5} \text{ gives}$$

$$\frac{a}{2} + \frac{b}{4} = \frac{3}{5}$$
 (2)

Solving these 2 equations, we have

$$a = \frac{3}{5}$$
 and  $b = \frac{6}{5}$ .

## Question 6

$$\frac{2ucston 6}{E[(X-1)^2]} = E[X^2 - 2X + 1] = E(X^2) - 2E(X) + 1.$$

Hence,  $E[(X-1)^2] = 10$  implies

$$E(X^2) - 2E(X) + 1 = 10$$
 (1)

$$E[(X-2)^2] = E[X^2 - 4X + 4] = E(X^2) - 4E(X) + 4$$

Hence,  $E[(X-2)^2] = 6$  implies

$$E(X^2) - 4E(X) + 4 = 6 (2)$$

Subtracting Equation (2) from Equation (1), we have

$$2E(X) - 3 = 4$$
 or  $E(X) = 7/2$ .

Substitute E(X) = 7/2 into Equation (1), we have  $E(X^2) = 16$ . Hence  $V(X) = E(X^2) - [E(X)]^2 = 16 - (7/2)^2 = 15/4$ .

# Question 7

We write the probabilities in the form of  $\Pr(|X - \mu| \ge k\sigma)$ , where  $\mu = 10$  and  $\sigma^2 = 4$ . We then apply Chebyshev's Inequality.

(a) 
$$\Pr(5 < X < 15) = \Pr\left[10 - \left(\frac{5}{2}\right)(2) < X < 10 + \left(\frac{5}{2}\right)(2)\right] = \Pr\left(|X - 10| < \left(\frac{5}{2}\right)(2)\right)$$

Applying Chebyshev's Inequality with k = 5/2, we have

$$\Pr\left(|X - 10| < \left(\frac{5}{2}\right)(2)\right) \ge 1 - \frac{1}{(5/2)^2} = \frac{21}{25}.$$

(b)  $\Pr(6 < X < 14) = \Pr[10 - 2(2) < X < 10 + 2(2)] = \Pr(|X - 10| < 2(2))$ Applying Chebyshev's Inequality with k = 2, we have

$$\Pr(|X - 10| < 2(2)) \ge 1 - \frac{1}{2^2} = \frac{3}{4}.$$

Hence,

$$\Pr(5 < X < 14) \ge \Pr(6 < X < 14) \ge \frac{3}{4}$$

(c) 
$$Pr(|X - 10| < 3) = Pr(|X - 10| < (\frac{3}{2})2)$$

Applying Chebyshev's Inequality with k = 3/2, we have

$$\Pr\left[10 - \left(\frac{3}{2}\right)(2) < X < 10 + \left(\frac{3}{2}\right)(2)\right] \ge 1 - \frac{1}{(3/2)^2} = \frac{5}{9}.$$

(d) 
$$\Pr(|X - 10| \ge 3) = \Pr(|X - 10| \ge \left(\frac{3}{2}\right)(2))$$

Applying Chebyshev's Inequality with k = 3/2, we have

$$\Pr\left(|X - 10| \ge \left(\frac{3}{2}\right)(2)\right) \le \frac{1}{(3/2)^2} = \frac{4}{9}$$

(e) We apply Chebyshev's Inequality to obtain

$$\Pr(|X - 10| \ge c) \le \frac{4}{c^2}$$

In order to determine a c satisfying the required inequality, we impose

$$\frac{4}{c^2} \le 0.04.$$

leading to  $c \ge 10$ . Choose c = 10 will ensure the probability at most 0.04.

## **Question 8**

(a)

$$f_X(x) = \begin{cases} 6x(1-x), & 0 < x < 1, \\ 0, & \text{otherwise.} \end{cases}$$

$$E(X) = \int_{-\infty}^{\infty} x \, f_X(x) \, dx = \int_{0}^{1} 6x^2 (1-x) dx = \left[ 2x^3 - \frac{3}{2}x^4 \right]_{0}^{1} = 0.5$$

$$E(X^2) = \int_{-\infty}^{\infty} x^2 f_X(x) \, dx = \int_{0}^{1} 6x^3 (1-x) \, dx = \left[ \frac{3}{2}x^4 - \frac{6}{5}x^5 \right]_{0}^{1} = 0.3$$

$$V(X) = E(X^2) - [E(X)]^2 = 0.3 - 0.5^2 = 0.05$$
Hence,  $\sigma = \sqrt{0.05} = 0.2236$ .

(b) To compute the exact value, we proceed as follows

$$\Pr(\mu - 2\sigma < X < \mu + 2\sigma) = \Pr(0.5 - 2\sqrt{0.05} < X < 0.5 + \sqrt{0.05}))$$

$$= \Pr(0.0528 < X < 0.9472)$$

$$= \int_{0.0528}^{0.9472} 6x(1 - x)dx$$

$$= [3x^2 - 2x^3]_{0.0528}^{0.9472} = 0.9839.$$

(c) Applying Chebyshev's Inequality to

$$\Pr(\mu - 2\sigma < X < \mu + 2\sigma) = 1 - \Pr(|X - \mu| \ge 2\sigma) \ge 1 - \frac{\sigma^2}{(2\sigma)^2} = \frac{3}{4} = 0.75.$$

(d) The answer in (c) states that the probability of X lies between two standard deviation above the mean and two standard deviation below the mean is at least 0.75, which is consistent with the actual probability 0.9839.

#### Question 9

Given that  $\mu = 900$  and  $\sigma = 50$ , hence, 700 is 4 standard deviation below the mean. Furthermore, since the distribution is <u>symmetric</u> about the mean implies that  $\Pr(X \le 700) = \Pr(X \le 900 - 200) = \Pr(X \ge 900 + 200)$ . Therefore,

$$Pr(X \le 700) = \frac{1}{2} [Pr(X \le 900 - 200) + Pr(X \ge 900 + 200)]$$

$$= \frac{1}{2} [Pr(X \le 700 \text{ or } X \ge 1100)] = \frac{1}{2} Pr(|X - 900| \ge 4(50))$$

$$= \frac{1}{2} Pr(|X - \mu| \ge 4\sigma) \le \frac{1}{2} (\frac{1}{4^2}) = 0.03125,$$
